

Filing													16/02/2023
Task 3													20/02/2023
Painting													20/02/2023
Designing games													21/02/2023
Task 4													23/02/2023
Nailing													23/02/2023
Task 5													24/02/2023
Hinges													24/02/2023
Lock													24/02/2023
Hooks													24/02/2023
Gun tacker													25/02/2023
Start Date:	10th February		End Date:	25th February		Total Days Taken:	15 Days						

C2: Demonstration of technical skill:

When **creating** this product, I certainly **developed** several skills throughout the process. This table includes the skill **developed** along with the description of the same and how it was used in the creation of the product. Furthermore, each skill has its evidence. These skills were divided into Research Skills, Planning and Designing, Aesthetics and Product making skills.

Skill Developed	Description	Skill Use	Evidence ⁹
<i>Research Skills</i>			
Researching and processing information	This skill is the collecting and processing of data to further help with designing and making of the product. This included the requirements for each board game.	This skill was used when researching the requirements and designs for different board games, the amount of game pieces and how to play each of these games. This skill was executed with the help of several websites and videos and Google Docs to document the information.	
<i>Planning and Designing</i>			
Measuring and Marking points/lines	In this skill, one can use a pencil or other drawing material along with measuring equipment to mark the necessary parts of a wood piece.	This skill was mainly used to measure and mark the parts which need to be put out to create a perfect 15 x 15 inch cube. Additionally this skill was used to mark the sections that needed to be painted.	

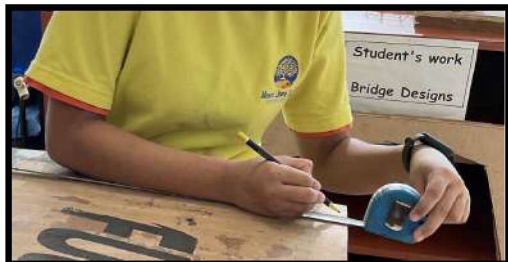

⁹ Evidence for technical skills in Appendix C.1

<i>Aesthetics</i>			
Painting and Spray painting	This skill refers to incorporating the factor of aesthetics in a product. This can be done with the help of acrylic paints and different types of brushes and spray paints.	This skill was majorly used to paint the border of each board. Each board is in the centre of the slab with a brown border. And a subtle thin Black exactly around the board game. Additionally spray painting was incorporated to spray paint the base block.	
Executing Colour Theory	This skill includes the mixing of colours to create the required colours.	Due to the lack of the colour, Brown, I was required to create this colour using other available colours. The colour brown was made with the help of red, blue and yellow.	
Digital Editing for each board game	This skill refers to the editing of existing board games to fit the size and shape based on the requirements of the final product.	Each of the board games were edited with the editing platform, Canva. These designs were later printed and put on the board.	
<i>Product Making Skills</i>			
Cutting the Wood	This skill included the cutting of wood with the help of cutting tools such as saws.	This skill was majorly used for cutting the excess parts of wood from the slabs required to make a cube.	
Drilling holes with the help of a drill on wood	The mentioned skill will be executed with a drill. These drills were further used for the use of star screws.	These drilled holes were used for the assembling of the hinges and the lock to the product. Both of these holes were later used for star screws.	
Nailing with hammer	This skill is the nailing of two pieces of wood together with a nail and hammer.	While forming the cube, nails were required. Several nails were required to fix 2 sides together. Several mistakes were made but these were later fixed and the cube was made strong.	

Using a Screwdriver	After drilling the holes, the screwdriver was used to tighten the screws on the hinges and the two parts of the lock.	This skill was used to attach the hinges and the lock for the product. This skill requires the push and twist technique. This technique certainly made the screws tighten much faster.	
Using a file and Sandpaper	Filers and sandpapers were used to smoothened edges.	Filers were used to remove large pieces of excess wood. Additionally, sandpaper was used to smoothen rough edges to make this product safe.	

C3: Creating the product/solution:

The table below is a constructive breakdown of the process followed to **create** the final product. Based on the Plan made in Criteria C, Strand (i), the plan was followed. Each step includes the process of each step, Equipment required, time taken and some extra details (if any). Additionally Evidence for the same is given in the table. Additional Evidence is given in the Appendix C2.

Steps, Equipment and Process and Extra Details (if any)		Evidence ¹⁰
Researching		
Step 1.1: Researching the rules and requirements		
Process: For this step, the rules and requirements of each board game in the product was researched. Extra Details: This step was majorly used to understand the rules of the game and number of players as this product is not ideal for more than 4 players.	Equipment: - Windows/Mac Operating System - Web browser - Youtube Videos - Websites - Rule books - Google Docs Time Taken: Approximately 3 hours	
Planning		
Step 2.1: Measuring and Marking (For Cutting and Painting)		
Process: This step includes measuring the pieces of the wood and marking points that need to be cut or marking the section that needs to be painted.	Equipment: - Purchased Wood - Rolling Parallel Ruler - Measuring Tape - Pencil Time Taken: 3 hours	

¹⁰ Evidence in Appendix in C.1
