

Using a Screwdriver	After drilling the holes, the screwdriver was used to tighten the screws on the hinges and the two parts of the lock.	This skill was used to attach the hinges and the lock for the product. This skill requires the push and twist technique. This technique certainly made the screws tighten much faster.	
Using a file and Sandpaper	Filers and sandpapers were used to smoothened edges.	Filers were used to remove large pieces of excess wood. Additionally, sandpaper was used to smoothen rough edges to make this product safe.	

C3: Creating the product/solution:

The table below is a constructive breakdown of the process followed to **create** the final product. Based on the Plan made in Criteria C, Strand (i), the plan was followed. Each step includes the process of each step, Equipment required, time taken and some extra details (if any). Additionally Evidence for the same is given in the table. Additional Evidence is given in the Appendix C2.

Steps, Equipment and Process and Extra Details (if any)		Evidence ¹⁰
Researching		
Step 1.1: Researching the rules and requirements		
Process: For this step, the rules and requirements of each board game in the product was researched.	Equipment: - Windows/Mac Operating System - Web browser - Youtube Videos - Websites - Rule books - Google Docs	
Extra Details: This step was majorly used to understand the rules of the game and number of players as this product is not ideal for more than 4 players.	Time Taken: Approximately 3 hours	
Planning		
Step 2.1: Measuring and Marking (For Cutting and Painting)		
Process: This step includes measuring the pieces of the wood and marking points that need to be cut or marking the section that needs to be painted.	Equipment: - Purchased Wood - Rolling Parallel Ruler - Measuring Tape - Pencil	
	Time Taken: 3 hours	

¹⁰ Evidence in Appendix in C.1

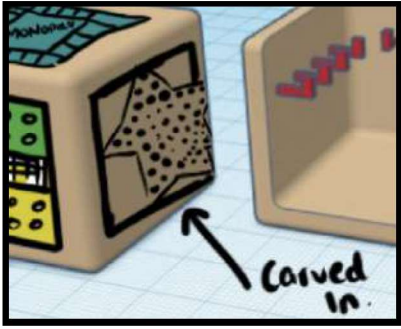

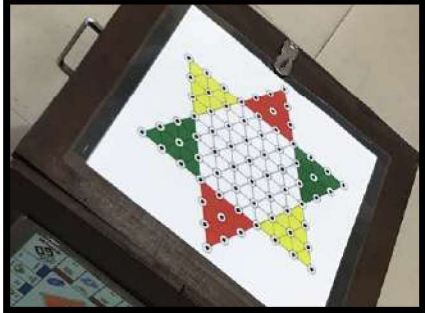

Step 2.2: Cutting		
Process: After marking several measurements, cutting tools such as an electric saw were used to cut the excess parts of the wood slabs.	Equipment: - Electric Saw - Plug Point - Saws Time Taken: 15 minutes	
Step 2.3: Filing and Smoothing of edges		
Process: After marking several measurements, cutting tools such as an electric saw were used to cut the excess parts of the wood slabs.	Equipment: - Electric Saw - Plug Point - Saws Time Taken: 15 minutes	
Aesthetics		
Step 3.1: Painting the border/exterior part of the product		
Process: This step included painting the borders of the product to add an aesthetic feature to the product. Brown and Black acrylic paints were used to create the borders. Extra Details: Due to unavailability of the colour Brown, I used colour theory to create the colour brown with the help of Red, Yellow and Blue paints.	Equipment: - Black, Yellow, Blue and Red Acrylic Paint - Size 6 Flat brush - Apron Time Taken: 2 Hours	
Step 3.2: Designing Each of the board games		
Process: This step was executed in an online platform, Canva. Existing Boards were edited and sized based on the product structure. Extra Details: Initially, the Star checkers board was supposed to be carved in, but this game is now played on a printed paper.	Equipment: - Windows/Mac Operating System - Web browser - Existing Board game designs. - Canva - Colour Print - Lamination - Drill - Filer - Sandpaper Time Taken: 30 minutes	
Arranging the product together		

Step 4.1: Nailing all the sides of the wood together		
Process: This step simply includes the assembling of the product into a cube with the help of nails and a hammer. A pencil was used to mark the point that needed a nail to make the product sturdy.	Equipment: - Nails - Hammer - Pencil Time Taken: 30 minutes	
Final Touches		
Step 5.1: Attaching the Hinges to the top piece of the product.		
Process: Perfectly spaced points were marked and a hole was drilled on the same. The hinges were then attached with the help of star screws.	Equipment: - Sketch Pen/ Black pen - Drill - Screws - Hinges - Screw Driver Time Taken: 20 minutes	
Step 5.2: Attaching the Lock and handles on the other end of the top piece		
Process: Similar to the hinges, the 2 piece lock was also incorporated in this product with the help of star screws at the centre of the edge of the top board. Additionally, handles were added with the help of screws to make the product easily mobile.	Equipment: - Sketch Pen/ Black Pen - Screws - Drill - Screw Driver - Lock (Includes 2 pieces) - 2 handles Time taken: 30 minutes	
Step 5.3: Attaching the hooks on the inside		
Process: Stick on hooks were used for the storage component of this product. Hooks were attached on each inner side of the cube.	Equipment: - Pencil - Ruler - Stick-on Hooks	
Step 5.4: Cutting and Spray Painting the base block		
Process: After adding the handles and the lock, then rotating the box, the product could not stand straight and as a solution, I incorporated a base block to keep the product on. This base block was thick enough so that the handle and the would stay above	Equipment: - Saw - Pencil - Black SprayPaint - Wood Time Taken: 30 minutes	

the ground. This block was cut and spray painted black to add to the aesthetics of the overall product.		
Step 5.5: Printing and Laminating the existing boards.		
Process: Each board game was printed based on the appropriate size for the product. The lamination was done at a store as I did not have the skill set or required resources for lamination.	Equipment: - Windows/Mac Operating System - Web browser - Canva - Colour Printer - Lamination Time Taken: 30 minutes	
Step 5.6: Sticking the boards on the product.		
Process: This step was done with the help of a Gun Tacker. Each laminated board was stuck to the product using the mentioned method.	Equipment: - 6 Laminated Boards - Gun Tacker Time Taken: 10 minutes	

C4: Justify your last minute changes.

When **creating** the product, certain changes were **identified** and rectified. These changes along with the **justification** for the same are mentioned in the table.

Sr.no	Before	After	Justification
1.	Initially, the star checkers board was supposed to include carved holes for the pieces. 	This feature is now a printed and laminated sheet that needs the game pieces to be placed above the shown spaces. 	The mentioned change was made to create a uniformed approach to all boards and to enhance the aesthetics of this side with several colours. Additionally, this method also helped save time as carving the multiple holes with precision would have taken days for quality results.
2.	When designing this product, the idea of handles was not included.	But after completing the over structure of the product, Handles were incorporated in the sides of the cube for convenience.	While moving around, there was a certain discomfort as the product was quite big. The handles make the product easier to carry around. Additionally, these handles were
