

Snacktive at temperatures ranging between 180-220°C. Additionally, various baking times were tried out, between 25 and 40 minutes to identify the ideal baking temperature and time range. During this process, I identified aroma, surface texture and color were key indicators of doneness. These indicators were essential to the identification of correct temperature and time ranges, thus enabling me to ensure Snacktive was crispy and crunchy, while also maximising shelf-life by reducing moisture.

Creating Innovative Flavours

Using creative and critical thinking skills, I intended to develop a host of new and innovative flavour options which could help attract the target audience. In this deep thought process, I undertook essential research in order to comprehend the general taste preferences of the group, and then curate flavours to meet the requirements. While identifying the general flavours was easy, developing seasoning mixes which hit the right notes was hard. This process came down to trial and error, experimenting with different ratios of seasonings like garlic powder or paprika to ensure just the right mouth feel. In the end, after multiple test batches, the correct formulation of 4 flavours was developed, helping Snacktive appeal to a broader range of consumers.

Apple Journal App Entry on the day of flavour curation.

Strand 3: Follow the plan to create the solution

No.	Resources	Process	Outcome
1	<u>Intended</u> - Laptop - Oven - Flour - Water - Salt - Baking Powder <u>Used</u> All	<u>Intended</u> 1. Identify the model of the oven available or intended for use. Download and thoroughly analyse the user manual of the oven readily available online. 2. Using the oven, test out how to enable each function and the various settings provided within each mode. 3. To test out the functioning of each mode, make simple baked vegetables in the oven, testing out the convection heating and broiler. <u>Completed</u> All processes completed Under the time limit	

2	<u>Intended</u> - Laptop - Blender - Bread - Oven <u>Used</u> - None	<u>Intended</u> 1. Identify the model of the blender available or intended for use. Download and thoroughly analyse the user manual of the oven readily available online. 2. Using the blender, test out each power setting and jar type (dry, wet, and juicer). 3. To test the functioning of all these modes and determine the power necessary for different ingredients, make breadcrumbs. This would help understand how much power is required to get a particular consistency. <u>Completed</u> None completed.	Incomplete
3	<u>Intended</u> - Laptop - Stove - Pan - Saucepan - Oil - Butter - Water - Vegetables <u>Used</u> All	<u>Intended</u> 1. Identify the model of stove available or intended for use. Download and thoroughly analyse the user manual of the oven readily available online. 2. Taking the necessary precautions, and in the supervision of another more experienced individual, ignite each flame, of varying sizes and test flame strength. 3. To test this understanding develop skills, make sauteed vegetables on the large flame using various flame strength settings. <u>Completed</u> All processes Under the time limit	
4	<u>Intended</u> - Kitchen Utensils - Fruits and Vegetables <u>Used</u> All	<u>Intended</u> 1. Identify the most relevant processes to learn as per the recipe determined in Criterion B, strand 3. In this case, those processes would be blending, boiling, soaking, and kneading. 2. Under the supervision of a more experienced individual, begin to turn on the stove and set a pot of water to boil. Once it reaches a boil, add black beans and maintain until cooked. 3. To master the art of soaking, simply submerge beans in water overnight, or until they double in size. 4. To master the art of kneading, follow the recipe in <i>Appendix XX</i> to make a simple flatbread dough, and knead until thoroughly combined. <u>Completed</u> All Under the time limit	

5	<u>Intended</u> - Various Raw Seasonings - Mixing Bowls - Spoons <u>Used</u> All	<u>Intended</u> 1. Gather the raw ingredients required as per Criterion B Strand 4. 2. Place a mixing bowl on a weighing scale and click the 'tare' function to reset weight. This would allow the user to measure the quantity added. 3. According to the recipe listed in Criterion B Strand 4, combine the raw ingredients. 4. Taste with simple flatbread made earlier. <u>Completed</u> All Under the time limit	
6	<u>Intended</u> - Kitchen Utensils - Dishwasher - Notebook - Pen <u>Used</u> All	<u>Intended</u> 1. Gather all equipment in accordance with Criterion B Strand 4. In this case, a large assortment of glass bowls, spatulas, the ingredients, the blenders, etc. 2. Ensure all this equipment has been thoroughly washed, preferably using a dishwasher at the highest heat settings (<i>or permitted for the equipment</i>). This ensures all tools are sterilized. <u>Completed</u> All Under the time limit	
7	<u>Intended</u> - Kitchen Utensils - Weighing Scale - Measuring Cups - Water - Stove <u>Used</u> All	<u>Intended</u> 1. With the gathered ingredients, follow the steps detailed in Criterion B Strand 4 to prepare these raw ingredients. 2. In this case, soak and boil the black beans until mushy. 3. Boil quinoa according to package instructions. <u>Completed</u> All Under the time limit	

8	<u>Intended</u> - Kitchen Utensils - Oven <u>Used</u> All	<u>Intended</u> 1. Following the plan detailed in Criterion B Strand 4, and referring to the step-by-step recipe in Appendix XX, complete all the steps. 2. Bake until crisp, dry and golden-brown. 3. Once out of the oven, immediately cover with the prepared seasoning mix to ensure it sticks. <u>Completed</u> All Under the time limit	
9	<u>Intended</u> - Snacktive - Consenting Human(s)	<u>Intended</u> 1. Allow the freshly baked snack to cool before attempting to consume. 2. Taste every seasoning mix with the cracker and identify areas of strengths and limitations. 3. After 24 hours, provide this snack to members of the target audience in order to further assess aspects of the snack. This will help determine its success compared to the success criteria. <u>Completed</u> All Under the time limit	
10	<u>Intended</u> - Kitchen Utensils - Oven - Raw Ingredients <u>Used</u> All	<u>Intended</u> 1. Based on the feedback received, alter the recipe as needed, making notes of the alterations. 2. Repeat the taste test process and determine which iteration yielded better results. <u>Completed</u> All Under the time limit	

11	<u>Intended</u> - Brown paper package - Paper - Glue <u>Used</u> All	<u>Utensils</u> 1. Through a local vendor, source the necessary packages. Refer to Appendix XX to understand the reasons behind this decision. 2. Using a printer, print the created packaging of Snacktive based on Crit B Str 4. 3. Using commercial packaging glue, stick onto the acquired package. 4. Transfer 100g of Snacktive into the pack and seal for sale. <u>Used</u> All Under the time limit	
----	---	--	--

Strand 4: Justify changes made to the plan

- No changes were made to the logical plan or the fundamental structure of the logical plan. The only notable change would be the skipping of Step 2 due to Expert Recommendation.

Change 1: Testing the oven using baked vegetables instead of salt crackers

Justification: This was a change made to the plan due to the convenience of using already diced vegetables in a seasoning mix instead of making a difficult dough in order to make salt crackers. These baked vegetables allowed me to understand how much time it took to cook them through, the likelihood of burning, and overall manage my expectations from the appliance. However, putting in the effort to make salt crackers would have allowed me to gauge the time required to create Snacktive, and understand the way dough behaves in the oven. Such a change to the logical plan is simple and without much consequence to the creation of the final product.

Change 2: Testing the blender by making Chimichurri and not Breadcrumbs

Justification: The goal of this step was to understand how the blender functions, the way the various speed settings interact with the contents inside the jar, and what jar is best suited to dry and wet ingredients. To fully test my knowledge on this particular topic, it made sense to make something that had components that were both wet and dry. Chimichurri was the perfect mix as garlic, dried chillies and other dried herbs required blending, eventually to be mixed with olive oil and blended cilantro - allowing for both dry and wet ingredients to be used. Using breadcrumbs to test my knowledge would have been without great consequence at all, only testing my knowledge on how to use dry blender jars and lower power settings.

Change 3: Testing the stove by making Chinese Style Stir-Fry and not Sauteed Vegetables or Steamed Beans

Justification: The goal of this step was to test my understanding of the stove, demonstrate compliance with safety protocol and create something that was cooked, not burnt and hopefully delicious. It became clear that in order to demonstrate all these skills, Chinese Stir-fry would have been most beneficial. The process of making this dish involves high-heat cooking, steaming with minimal water and deglazing with various sauces - a combination that would challenge my skills across the board.

Change 4: Changing the composition of Snacktive to improve texture
