Additional Support (SOS)

- To code my app, I need a device ecosystem that supports **Visual Studio Code, React Native, Appwrite** and **Expo CLI** so that I can code and run the app. By using my updated MacBook Air with the M2 chip, I will ensure the code runs and resolve technical issues during the creation process. Additionally, using my updated iPhone 14 Pro running iOS 26, I will provide the code; it is viable, and the app is functioning correctly. However, it will also run on Android devices. These are the easiest and most efficient tools to code my app.

Criterion C: Creating the Solution

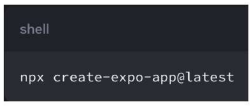

Strand 1: Construct a Logical Plan

S. no	Tasks	Description	Resources needed	January																								February										
				1-9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	1	2	3	4	5	6	7	8	9	10	11
1	Learn JavaScript basics for app development	I will learn the basics of JavaScript required for React Native, including variables, functions, components, and simple logic, so I can understand and write code for the app.	JavaScript tutorials (YouTube), React Native documentation, VS Code, practice exercises																																			
2	Set up development environment	I will install and verify Node.js, Expo CLI, and ensure Visual Studio Code is ready for development. This ensures smooth app creation without technical delays.	MacBook, VS Code, Terminal																																			
3	Initialise Expo Project	I will create a new Expo project and successfully run it on my iPhone using Expo Go to confirm the setup works.	Expo CLI, Phone, Expo Go																																			
4	Organise Folder Structure	I will structure folders for screens, components, assets, utilities, and storage to maintain clean and manageable code.	VS Code																																			
5	Implement Navigation System	I will set up stack and tab navigation to connect Login, Dashboard, Calm, Appointments, Safety, and Settings screens.	React Navigation, VS Code																																			
6	Build Login & Registration Screen	I will design and code the login and registration page with input validation and navigation to onboarding.	VS Code, AsyncStorage																																			
7	Create Onboarding Questionnaire	I will design and implement the questionnaire that collects triggers, age, therapist details, visual and audio preferences.	VS Code, UI components																																			
8	Implement Local Data Storage	I will use AsyncStorage to store user preferences securely for app personalisation across sessions.	AsyncStorage, VS Code																																			
9	Build Dashboard Screen	I will create the dashboard including stress sliders, symptom tracker graph placeholder, and daily task overview.	VS Code, chart components																																			
10	Integrate user guide	I will integrate a small interactive user guide which will be directing the user on the features of the app, this will be done only after signing up and filling out the questions.	VS Code, Expo Go																																			
11	Develop "Calm Now" Feature	I will implement the two-step calming feature that instantly activates visuals or audio based on user preferences.	VS Code, Expo APIs																																			
12	Integrate Audio Library	I will add soothing sounds with play, pause, and volume controls using expo-av.	Audio files, expo-av																																			
13	Integrate Video Screen	I will implement calming visuals such as nature loops and animations with motion reduction support.	Image assets, Video component, VS Code																																			
14	Create Suggested Activities Screen	I will build the activity suggestion screen categorised under Emotions, Mind, and Body.	Image assets, VS Code, Video components																																			

15	Build Appointment & Calendar Screen	I will implement a calendar layout to schedule and store therapy sessions.	Calendar component, AsyncStorage, VS Code	
16	Develop Diet & Medication Tracking Screen	I will code meal plan tracking, medication reminders, and health statistics sections.	VS Code, AsyncStorage	
17	Implement Therapist Chat Interface	I will build a basic therapist chat UI with restricted access during office hours.	VS Code	
18	Integrate GPS Calm Spaces Feature	I will integrate Expo Location API to display nearby calm spaces while respecting privacy permissions.	Expo Location API	
19	Implement SOS Emergency Feature	I will create an SOS feature with shake detection and confirmation before alerting emergency contacts.	Device sensors, VS Code	
20	Build Settings Screen	I will implement profile, privacy, appearance, and preferences settings.	VS Code	
21	Conduct Self Functional Testing	I will test all features together to ensure navigation, data storage, and personalisation work correctly.	Phone, Expo Go, test checklist	
22	Conduct Self Performance & Security Testing	I will test responsiveness, loading time, age restrictions, SOS confirmation, GPS permissions, and safe data handling.	Phone, test log, security checklist	
23	Collect appraisals from clients and target audience	I will collect appraisals from pyschologists, therepists and target users on the app behaviour across sessions to check data persistence, usability, and overall calming effectiveness, and gain feedback for improvement.	Phone, checklist, screenshots	
24	Final review and documentation	I will organise screenshots, testing evidence, and final outputs for submission.	Screenshots, notes	

Strand 2: Demonstrate Technical Skills

To code my app, I will use Visual Studio Code, React Native and Expo.

Visual Studio Code While working in Visual Studio Code, I will use these commands to code my final app, which includes all the features and backend code.			
Command		**Image**	**Intended usage**
1	**Terminal**		This command opens Visual Studio Code's terminal, runs my shell commands, and ensures the app is built.
2	**New Folder**		This tool lets me add folders to organise my code and store the JavaScript folders provided by Expo.
3	**New File**		This tool allows me to insert files into their respective folders to better organise my code and extensions.
4	**Extensions**		This feature allows me to access React Native in Visual Studio Code. I was able to add my React Native code and snippets, which will enable me to add the plug-in features of React Native
React Native While working with React Native, I will use the shell to set up the Expo JavaScript environment. This allows me to run Expo and the JavaScript code on Visual Studio Code.			
1	**Expo Project**		To create a new Expo project, I must run the following shell in my terminal, ensuring that my Expo project is created with the folders and packages I will be needing
