Criterion C(B3.1, B3.2)

Strand 1: Logical Plan

S.No	Tasks	Descriptions	Resources Needed
1	Learning Coding	I will learn HTML structure, CSS styling (layout, flexbox, spacing), and PHP basics (variables, forms, $_GET, $_POST, sessions). I will practice by building small test pages and understand how XAMPP runs a local server.	VS Code for coding practice, XAMPP for running PHP locally, Chrome DevTools for testing, and online references such as W3Schools and MDN for HTML, CSS, and PHP tutorials.
2	Environment Setup & Project Structure	I will install XAMPP, create the project folder inside htdocs, and organize the project files. I will structure the project with multiple PHP pages for different features and ensure the application runs correctly on localhost using Apache and MySQL	XAMPP (Apache server), the htdocs directory for file storage, VS Code for project organization, and basic PHP documentation for setup guidance.
4	Sign Up / Login Page	I will create the authentication system that allows users to sign up and log in. I will design HTML forms for user input, use PHP to process form data ($_POST), connect to the MySQL database to store and verify user information, and use sessions to keep users logged in and redirect them to the dashboard.	HTML form documentation, CSS styling references, and VS Code Live Preview to test form structure.
5	Dashboard Page	I will build the main dashboard interface where users can access all app features. I will structure the page using HTML containers and card-style navigation, display the user's name using PHP session variables, and style the layout with CSS flexbox and icons.	CSS Flexbox/Grid references, layout wireframes for design guidance, and browser inspector tools for spacing adjustments. VS Code
6	Profile Page	I will create the patient profile page that displays personal and health-related information. I will design structured information sections using HTML boxes and retrieve the user's name from session data, ensuring only the logged-in user can access their profile.	CSS styling guides, reusable card layout references, and VS Code for structured HTML coding. VS Code
7	Records page	I will create a medical records interface that organizes health data into structured sections such as reports, health status, doctor advice, and improvement plans. I will use HTML containers and CSS styling to visually separate and organize the information clearly.	HTML div structure documentation, CSS box model reference, and Chrome browser for layout testing. VS Code
8	Vitals Page	I will build a vitals monitoring page that displays health indicators such as blood pressure, sugar levels, and weight. I will structure the information into summary boxes and detailed readings using HTML and CSS to create a clear and easy-to-read layout.	HTML button/input documentation, CSS positioning guides, and DevTools for UI testing. VS Code
9	Doctor Calls + Doctor Consultations	I will develop pages that allow users to log doctor consultations and track calls with healthcare providers. I will build HTML forms to collect consultation details, use PHP to process and save the information into the MySQL database, and implement filter logic to display important consultations.	PHP form-handling documentation, HTML textarea/input references, and Apache via XAMPP for backend testing. VS Code
11	Pill Guide & Lifestyle Coach	I will create guidance pages for medication and lifestyle habits. These pages will use structured HTML sections and styled layouts to present helpful health information in a simple and accessible format for users.	CSS layout guides (Flexbox/Grid), structured UI references, and VS Code for component building. VS Code
12	Connecting it to XAMPP	I will run the project on a local server using XAMPP by placing the project folder inside htdocs. I will start Apache and MySQL from the XAMPP control panel and access the application through localhost in the browser.	XAMPP (Apache server), the htdocs directory for file storage, VS Code for project organization, and basic PHP documentation for setup guidance.
13	MySQL	For the 3 Screens that require, data storage , I will create data tables in MySQL to ensure the function	XAMPP, MySQL
16	UI Refinement	I will improve visual consistency and responsiveness.I will do this by adjusting CSS spacing, font sizes, and testing mobile view using browser developer tools.	XAMPP & VS Code
17	System Testing	I will test full system functionality. I will do this by navigating through all pages and debugging PHP errors using Apache logs.	XAMPP & VS Code
19	Final Fixes	I will resolve remaining bugs. I will do this by reviewing PHP warnings and layout inconsistencies.	XAMPP & VS code

Strand 2: Demonstrating Technical Tools

HTML			
N.o	**Tool**	**Image**	**Intended Usage**
1	Form	`<form>`	Used to collect user input, in my case used to collect registration details, appointment requests and respective information
2	Input Fields	`<input>`	Used to restrict and verify user data, in my case, it is used to sure accurate entry of patient detils, including medical history, age, etc.
3	Button	`<button>`	Used to trigger navigation or activation of features. In my case, it is used to allow booking of appointments and submission of healthcare data.
4	Labels	`<label>`	Used to improve visibility and clarity. In my case, it clearly highlights labels of medication, vitals and more
5	Div & Section	`<div>` `<section>`	Used to structure webpage into logical containers. In my case it is used to separate sections like patient profile, pill guide and more.
6	Line break	` `	Used to create a ine break and move content to the next line, in my case was used to separate patient details to improve easy navigation.
