

	product follows the given dimensions; Length: 4.75 Inches, Width: 4.75 Inches, Height: 1.5 Inches. This acts as an advantage because this product is quite small. This means that it is easy to store and travel with.	which is a one player game and the other game is a 2 player game. This is restricting as multiple people cannot get together.
Function	(i) This is a foldable game. Peg solitaire is a one player game. And the other game is a two player game. (ii) There is no storage space in this product for the marbles required for peg solitaire and the x and o pieces.	
Material	(i) This product is completely made out of durable fine wood. The game pieces such as the marbles are made out of marbles and the tic tac toe pieces seem to be made out of either paper/cardboard.	

A4: Develop a detailed design brief that summarises the analysis of relevant research

Board games have long been a favourite pastime for people of all ages. However, one of the most difficult aspects of owning board games is finding enough space to store them. This can be especially difficult for families with children over the age of six, who tend to accumulate more games over time. To **address** this issue, I intend to **create** a design that combines multiple board games while taking up less space. The first step in **designing** this solution was to conduct extensive research into the needs of the target audience. This research included both primary and secondary research. This further required conducting surveys or interviews with families to **explore** the types of board games they enjoy playing and the amount of storage space they have available.

Survey⁵:

Surveying or interviewing families about their board game preferences can provide information not only about storage requirements, but also about the specific types of games that are popular among the target audience. I further used some of this information to

What board games do you play? (List)

I like chess

no

Ticket to ride, sequence, code names, monopoly

i dont

Monopoly

cards against humanity

Ludo, Monopoly, Clue,

house, life, ludo, monopoly

ludo, code names, ticket to ride, snakes and ladders,

create a product that meets the needs and interests of the target audience. Firstly I needed to understand the number of people in an average family. This answer ranged from 2 all the way to 19. The best way to **collect** data will be finding the most common answer and stem my research from there. Based on the information in the survey, families with 3-4 members were repeatedly mentioned. This helped me understand that ideally these games should be 2-4 player games to include multiple people and bring several people together. This product should not include one player games as that defeats the purpose of bringing communities together with board games.

In this case, the survey revealed information about popular board games such as Ticket to Ride and Codenames that I was not previously aware of. As a result, the designer decided to conduct additional research on these games in order to better understand their gameplay mechanics and design elements. And further **analyse** the relevance of these games in the product that needs to be designed.

Interviews⁶:

Here is a short **summary** of the interviews that I conducted and the key points from these interviews.

⁵ Survey Responses: Appendix A.2

⁶ Evidence for Interviews is A.3

Interview with Target Audience (Member of a family that plays a lot of board games): With the help of this interview, I learned about the games that they like to play, how often they like to play said games and the amount of space that they keep for board games and how many board games go there. Information like this helped me **design** the vague success criteria of the product.

Interview with Engineer: He advised on how to make the final product both functional and aesthetically pleasing. They may be able to provide insights into the best materials and components for the design, as well as advice on how to optimise the product for ease of use and durability.

Secondary Research:

After conducting the required research, I moved on to Secondary Research. For this section of the research, I mainly focused on the Aesthetics and Function.

Aesthetics of a product can be **measured** in a variety of ways. To begin, the product's overall design should be visually appealing and eye-catching. Using a variety of colours and designs can help the product stand out and capture the attention of the target audience. The finished product should be clean and polished, with no rough edges or visible flaws. Second, the design should be appropriate for the intended audience. For families with children over the age of six, the product should have a fun and playful design that appeals to children while also pleasing to adults. The use of bright colours and patterns can help make the product more appealing to children, whereas a more minimalist design with muted colours can help make the product more appealing to adults. Thirdly, the functionality of the product should be considered when evaluating its aesthetics. With clear instructions and an intuitive design, the product should be simple to **use** and navigate. The storage area should be well-organised and easily accessible, with game pieces and accessories arranged aesthetically and functionally.

Target Audience:

The target audience for this product are families with children over the age of six who enjoy playing board games. This product is intended to appeal to this demographic by offering them a convenient, interactive, and tangible way to store and play their favourite board games. Families with children over the age of six are likely to have a collection of board games that they enjoy playing with their children. However, because these board games take up a lot of space, they can be difficult to store. This product seeks to address this issue by combining several board games into a single compact design that takes up less space. This allows families to have access to a wide range of board games. Board games are a fun way for families to spend quality time together. This product is intended to improve on that experience by offering a visually appealing and interactive way to play multiple board games. Families can enjoy playing together without having to switch between multiple game boxes by combining different board games into one product.

Criterion B: Developing ideas

B1. **Develop** a list of design specifications/success criteria for the solution

Success Criterias provide clear guidelines and expectations for achieving a goal or objective. They **create** a shared vision of what success looks like and assist in measuring progress, tracking performance, and making adjustments. They assist in focusing efforts, staying on track, making data-driven decisions, and ensuring that resources are used effectively and efficiently to achieve desired results. And therefore, **creating** a success criteria for this solution was vital. Written below is the Success Criteria following the ACCESS FM format along with a **description** and its **justification**.

Criteria	Description	Justification/Connection with Research
Aesthetics	The board should include more than 4 board games. The board should include sufficient storage. This board should be a shade of brown to show the shade of the natural wood. Additionally, the board should include various colours so that it is not monotonous.	The purpose of this product is to combine multiple board games together. Additionally, this product caters to multiple age groups as it targets families. Children tend to be attracted to colour and hence it is essential that the product includes multiple colours. But it should not be too colourful that it comes off as
